▼ Request Headers
:authority: www.reddit.com
:method: GET
:path: /r/TUDe1ft/
:scheme: https
accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/avif,image/webp,image/apng,*/*;q=0.8,application/signed-exchange;v=b3;q=0.9
accept-encoding: gzip, deflate, br
accept-language: en-GB-oxendict,en-US;q=0.9,en;q=0.8,nl-NL;q=0.7,nl;q=0.6
cache-control: max-age=0
```

The cache control header has multiple keys. The first is **private**. This means that the response may only be saved in the, private, browser cache. This is usually done for personalised pages as they are different for every user, so it does not make sense to store a cached version on the server side. The **s-maxage** key is basically the same as the **max-age** key, which is the next one. They both represent an absolute amount of time in seconds until the cached version is no longer valid. The only difference is that **s-maxage** is for shared cache, but this cache is private so this key is useless in this case. The **max-age** key is used for private cache. The value attached to the key is 0, which indicates that if the browser stores this response, it will instantly become invalid. The **must-revalidate** key means that the response can be stored in cache and can be reused while still valid. If the maximum age has been reached it should be validated with the origin server before reuse. The **no-store** key indicates that any cache of any kind should not store this response.

All in all the cache control indicates that this response shouldn't be stored.

1.4

The **accept-encoding** header in the request headers contains the types of encodings the browser supports. In this case **gzip**, **deflate** and **br**

2.1

Input

```
``bash
telnet httpbin.org 80|tee output.txt
``
```

Output

```
``bash
Trying 54.156.165.4...
Connected to httpbin.org.
Escape character is '^]'.
``
```

Request

```
``HTTP
PUT /myfile HTTP/1.1
host:httpbin.org
Content-type:text/plain
Content-length:12
<carriage return>
``
```

I could not type the content I wanted to sent. After the carriage return, the response came immediately.

Response

```
``HTTP
HTTP/1.1 404 NOT FOUND
Date: Wed, 22 Dec 2021 13:06:34 GMT
Content-Type: text/html
Content-Length: 233
Connection: keep-alive
Server: gunicorn/19.9.0
Access-Control-Allow-Origin: *
Access-Control-Allow-Credentials: true
```

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 3.2 Final//EN">
<title>404 Not Found</title>
<h1>Not Found</h1>
<p>The requested URL was not found on the server. If you entered the URL manually
please check your spelling and try again.</p>
``
```

The resource **/myfile** does not exist, so a 404 error is sent as a response indicating that the resource could not be found. So the creation of a new resource is not allowed.

2.2

Input

```
```bash
telnet httpbin.org 80|tee output.txt
```
```

Output

```
```bash
Trying 54.156.165.4...
Connected to httpbin.org.
Escape character is '^]'.
```
```

Request

```
```HTTP
PUT /put HTTP/1.1
host:httpbin.org
Content-type:text/plain
Content-length:11
<carriage return>
Hello World!
<carriage return>
```
```

Response

```
```HTTP
HTTP/1.1 200 OK
Date: Wed, 22 Dec 2021 13:16:59 GMT
Content-Type: application/json
Content-Length: 337
Connection: keep-alive
Server: gunicorn/19.9.0
Access-Control-Allow-Origin: *
Access-Control-Allow-Credentials: true
```

```
{
 "args": {},
 "data": "Hello World",
 "files": {},
 "form": {},
 "headers": {
 "Content-Length": "11",
 "Content-Type": "text/plain",
 "Host": "httpbin.org",
 "X-Amzn-Trace-Id": "Root=1-61c32546-3c3a09a72eadb27b6a684ac7"
 },
 "json": null,
```

```
"origin": "185.229.55.127",
"url": "http://httpbin.org/put"
}
```

HTTP/1.1 400 Bad Request

Server: awselb/2.0

Date: Wed, 22 Dec 2021 13:16:59 GMT

Content-Type: text/html

Content-Length: 122

Connection: close

```
<html>
<head><title>400 Bad Request</title></head>
<body>
<center><h1>400 Bad Request</h1></center>
</body>
</html>
...
```

It seems that if you make the content-length shorter than the content. The server thinks the whole message has been received at the 11th character and sends a response that the PUT was a success. When the 12th character is received the server realises that something went wrong and sends a 400 response.

**\*Input\***

```
```bash  
telnet httpbin.org 80|tee output.txt  
...
```

Output

```
```bash  
Trying 54.156.165.4...
Connected to httpbin.org.
Escape character is '^]'.
...
```

**\*Request\***

```
```HTTP  
PUT /put HTTP/1.1  
host:httpbin.org  
Content-type:text/plain  
Content-length:20  
<carriage return>  
Hello World!  
<carriage return>  
<carriage return>  
<carriage return>  
<carriage return>  
...
```

Response

```
```HTTP
```

```
HTTP/1.1 200 OK
Date: Wed, 22 Dec 2021 13:42:49 GMT
Content-Type: application/json
Content-Length: 354
Connection: keep-alive
Server: gunicorn/19.9.0
Access-Control-Allow-Origin: *
Access-Control-Allow-Credentials: true
```

```
{
 "args": {},
 "data": "Hello World!\r\n\r\n\r\n\r\n",
 "files": {},
 "form": {},
 "headers": {
 "Content-Length": "20",
 "Content-Type": "text/plain",
 "Host": "httpbin.org",
 "X-Amzn-Trace-Id": "Root=1-61c32b55-0a268380359393a770905da7"
 },
 "json": null,
 "origin": "185.229.55.127",
 "url": "http://httpbin.org/put"
}
...
```

In the case that you make the content-length longer than the content, you have to keep adding character until the content-length has been reached. So in this case the data contains a lot of carriage return and new line characters, because 4 carriage returns were typed in the content of the request

### 3.1

You do not have to fill in the login details again, because the browser stores these details and automatically sends them with future requests. This prevents an unnecessary request and 401 response.

### 3.2

**\*Input\***

```
```bash
telnet httpbin.org 80
...
```

Output

```
```bash
Trying 34.230.191.51...
```

Access-Control-Allow-Credentials: true
```
```

This is not the same behaviour as in the browser. In the browser, after requesting the page after having logged in, the required authorization was automatically sent to the server. The terminal does not save and automatically send the authorization requested after having logged in, so you have to authorize again manually.

Connect four

4.2

1. <https://connect-4.org/en>
2. <https://c4arena.com/>
3. <https://buddyboardgames.com/connect4>

All 3 versions follow the basic design principles of: “Don’t make me think”, “Minimize noise and clutter” and “If you cannot make it self-evident, make it self-explanatory”. Aesthetic-wise the first one is not pleasant to look at, while the other two looked very simplistic in a good way.

The third one wasn’t self-evident nor self-explanatory, connecting to the game is very complicated.

4.3

The third one had sound, but it was very annoying. So this is not something we want to use in our game. We also did not like the colors used in the first one. We could not join a random room in the third version, which was annoying. We liked the clean/modern design of the second and third one, the animations of the pieces falling down, the column highlighting and winning animations were nice features in the second and third versions. In the second version you could also play against an AI.

5.1

Title: Connect IV

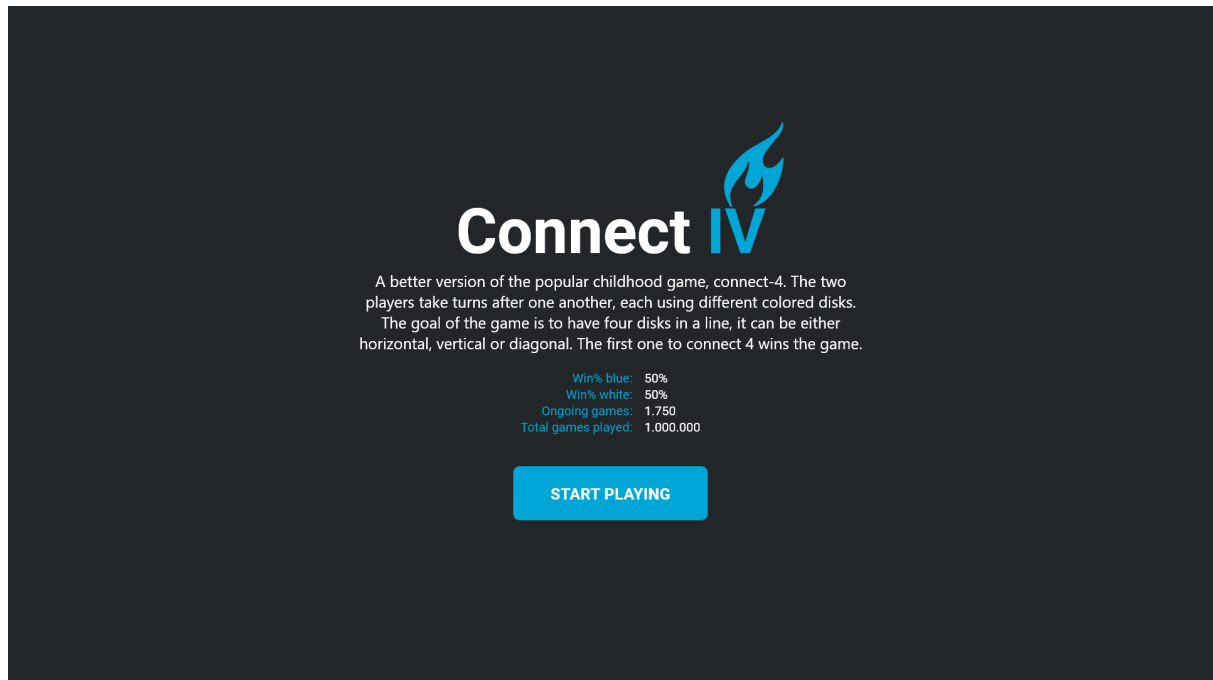

Description: A better version of the popular childhood game, connect-4. The two players take turns after one another, each using different colored disks. The goal of the game is to have four disks in a line, it can be either horizontal, vertical or diagonal. The first one to connect 4 wins the game.

Colors: #00A6D6, #222629 & #FFFFFF

Assignment JS+Node

2.1

- Store and show statistics
- Look for other players when 'play button' is pressed

- Once game is found, game automatically starts
- Server supports multiple games at the same time
- The validity of every move is checked
- If a player drops out, the game is aborted
- If winning condition has been reached, this should be displayed to all users
- Show time since game has started
- Show countdown timer, if move takes too long
- Disk falling animation
- Column highlighting

2.2

We can create a Game object, which holds all the games values. We can make a board object which stores the current board position and we can make a disk object which holds the color and neighbours for easy win condition calculation
